

IPTAP Context Menu development

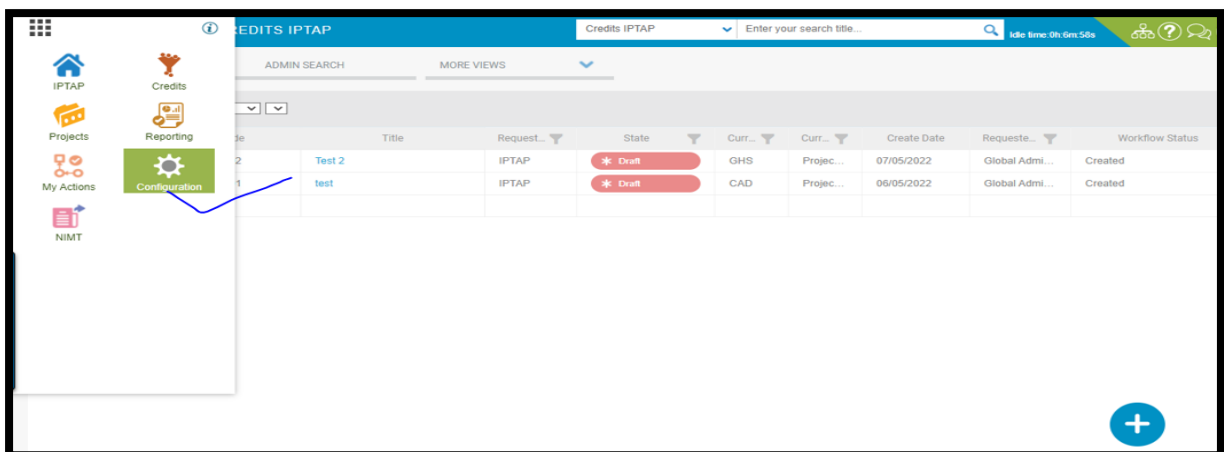

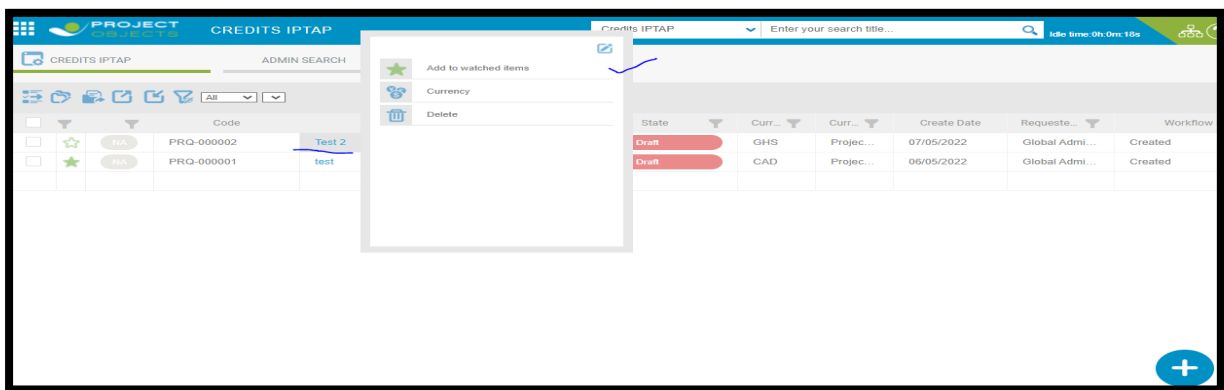

Features: We have created configuration setting for context menu items as user want to make the visibility of context menu item as per their requirement, he can make it possible from form builder.

Project workspace will not be available from anywhere in the application like (Project title click, Project context menu, Global search, home page and my action etc.)

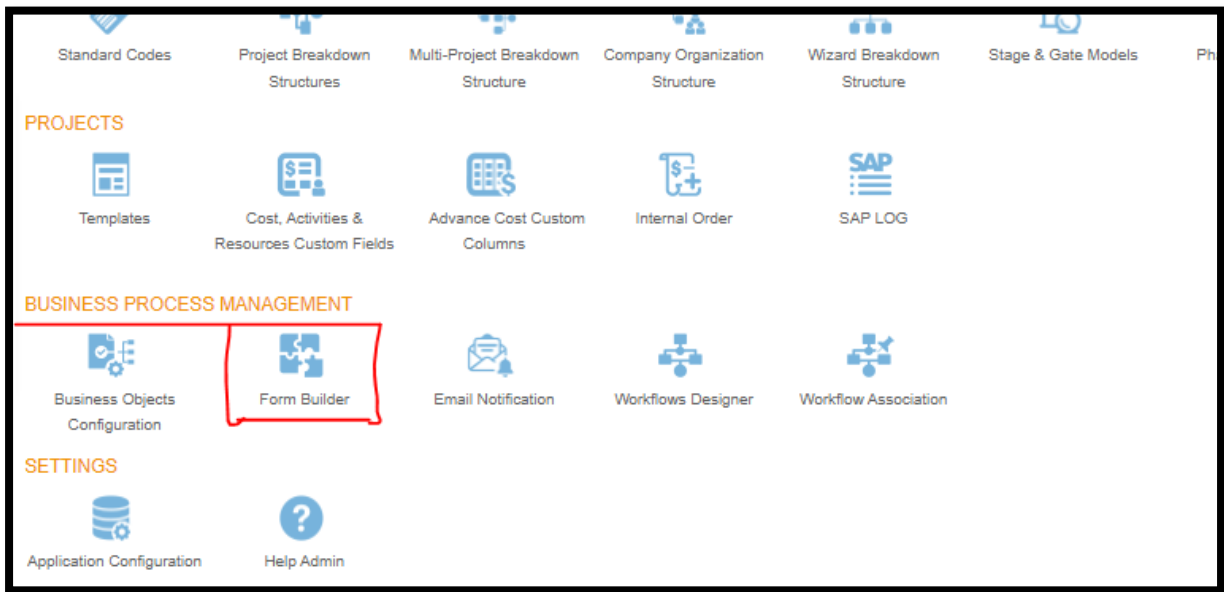

We have implemented the configuration of accessibility for workspace in form builder.

Functionality: In IPTAP credit register, we right click on object title and open a context menu. In context menu workspace icon is hide and edit icon is visible, User can add options in context menu accordingly from form builder in configuration.

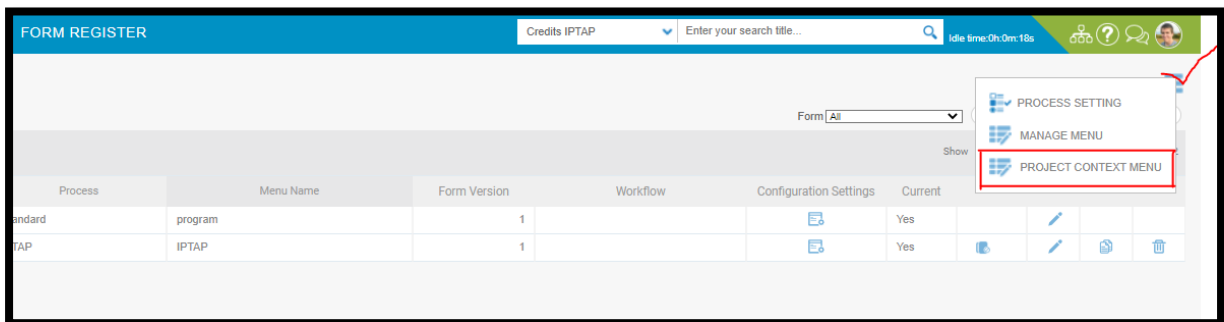

Configuration > Business Process Management >Form Builder > (Top right corner) Project context menu

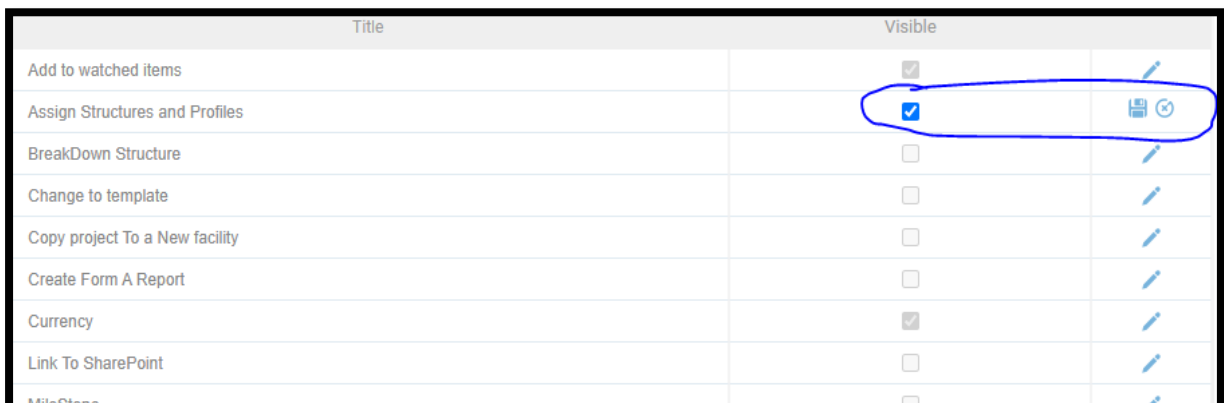

Select Form Builder under business process management.

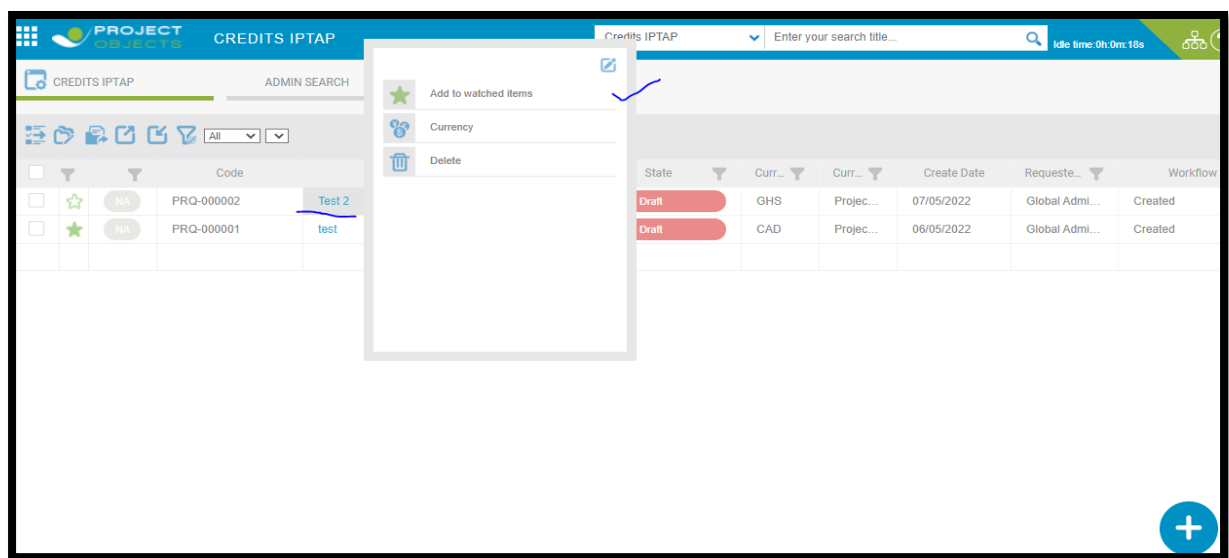

In Form builder we click hamburgur menu then select Project Context Menu.

Page pop-up for editing context menu is here.

After save assign structure and profiles, it will be visible in Project register context menu and also Project Workspace and Workspace icon is not visible for any condition anywhere in application.

Thank You.....
